

THINMAN

smart identity

Secure and simple access to your Company's resources

Accessing resources easily and securely is a requirement of any company. For this reason, there are different motivations for finding solutions that allow controlled and optimized access to resources. Among the main drivers of this research are:

- Security
- The speed and simplicity of access
- Control of users and accesses

Praim, always sensitive to these needs, has developed a new solution that gives a concrete answer to these requests: ThinMan Smart Identity.

ThinMan Smart Identity is an additional ThinMan Platinum Edition module that allows users to access their devices and resources using a personal smart card.

Security: choose your level

ThinMan Smart Identity allows you to implement a multi-factor authentication, manage user access, enforcing security. The administrator can decide the authentication parameters that he wants to implement: from simply inserting the card into the reader, to requesting a card plus username and password or PIN.

Access speed: fast login and application roaming

Access to resources often does not require an extreme level of security, but instead requires high speed and the agility to log in from different workstations.

Using ThinMan Smart Identity you can provide users with a physical key that makes the authentication process faster on different workstations, "moving" their resources from one workstation to another in a simple and time-saving way.

Choose your card: contact or contactless?

Praim Smart Identity is designed to work with many smart cards and readers: both with physical reading of the card through insertion (contact), and with proximity card with NFC (contactless) technology.

Companies can count on the support of the most common cards, like a company badge, saving on the purchase costs of new smart cards.

User and access control: versatility and scalability

Smart Identity allows you to enable different types of access and security, in a granular way, with total control of both users and authentication methods used.

The enrollment process is totally under control of the administrator, who decides which devices could enroll the smart cards, how many cards an user can enable, as well as decide to block unwanted devices and smart cards.

Easy, controlled and secure access on PC and Thin Client

ThinMan Smart Identity is available as an add-on to the Platinum Edition of ThinMan Management Console. Smart Identity is compatible with Agile, the Praim solution for centralized PC simplification and control, and with all Praim Thin Client devices (Windows and ThinOX).

In addition to the software component, Praim offers NFC readers and certified cards to ensure perfect operation of ThinMan Smart Identity solution in any context of use.

Licensing

Smart Identity is available as a user lease fee, which can be used on the ThinMan Platinum Edition endpoint management console.
