THINMAN
the management

Praim

A single console to manage all endpoints

Automation, Management and Organization

ThinMan is the console for the **centralized management of all company devices**: thin clients or PCs. With Thin-Man, the IT administrator has all the information on the endpoints and their configuration at hand, he can create new workstations in a few minutes and offer remote assistance quickly and effectively.

All activities that can be implemented with ThinMan require a few clicks, making the management, organization and automation of all the devices simple and complete: from energy saving, to updating the software and creating user policies.

New ThinMan Advanced Edition

In its renewed version, ThinMan Advanced Edition follows an annual subscription-based licensing model. To enrich ThinMan's functionality, **3 Feature Packs** have been introduced that meet the specific needs of each reality, thus **customizing the offer according to the use case**.

To use the new ThinMan it is not necessary to modify the corporate network: it is also possible to manage the devices from the Cloud.

ThinMan is available in two different versions

1 **ThinMan Basic:** the free version, with limited functionality, dedicated to the management of endpoint parks consisting of a few units.

2 **ThinMan Advanced:** the version that includes the functionalities necessary to manage endpoint infrastructures formed by any number of devices.

3 new Feature Packs

To offer a more personalized service designed on customer needs, Praim offers **3 ThinMan Advanced Feature Packs** in which various specific features are enclosed.

NETWORK +

For complex network cases, remote offices or with limited bandwidth.

ADMIN +

For those who need high reliability and advanced security.

USER +

For those who need modern access, with advanced user profile.
